Local x, y, z motion among surviving atoms
Temperature is an energy-matched estimate; distributions need not be thermal.
Energy-matched temperature
Temperature estimate (uK)
time (ms)
x
y
z
Excitation above the ground state
Mean energy / kB (uK)
time (ms)
x
y
z
Motional ground-state fractions
P(n=0 | survived)
time (ms)
x
y
z
x: survivor energy change
Energy removal / kB (uK/ms)
time (ms)
Net
y: survivor energy change
Energy removal / kB (uK/ms)
time (ms)
Net
z: survivor energy change
Energy removal / kB (uK/ms)
time (ms)
Net
Bands: pointwise approximate 95% Monte Carlo intervals; derivative bands include temporal covariance.
Positive = decreasing survivor energy. Net includes loss selection; its separate contribution is unavailable.
